SHARK SECRETS

A DETAILED study of great white sharks has found they spend a lot more time feeding along the seabed than previously thought.

The study into their diet was done by a team at the Charles Perkins Centre and School of Life and Environmental Sciences at the University of Sydney. They studied the predators off the east coast of Australia and found the remains of fish that live on the bottom of the ocean in the stomachs of more than 40 young sharks. This evidence supports data from tagged great white sharks that shows they spend a lot of time many metres below the surface of the ocean.

Lead author Richard Grainger said: "The stereotype

Lead author Richard Grainger said: "The stereotype of a shark's dorsal fin above the surface as it hunts is probably not a very accurate picture."

The full study was printed in the journal Frontiers in Marine Science.

PANGOLIN scales are no longer officially listed as an ingredient to be used for traditional Chinese medicine.

2

The news was reported in medical journals in China this week. It comes as China raised the protection level for pangolins to the highest in the country. Both changes are good news for pangolins, which are the most-trafficked animal species in the world. They've come very close to extinction due to the illegal wildlife trade. As many as 200,000 are consumed each year for their scales and meat.

SCIENTISTS believe that an ancient species of crocodile that lived around 120 million years ago walked on its two back legs – just like a

dinosaur!

The discovery comes after researchers analysed huge fossilised footprints found in South Korea. The study, which appeared in the journal Scientific Reports, revealed that the footprints belonged to what scientists think is a new species of crocodylomorpha, the ancestors to modern-day crocodiles and alligators.

They think these super-crocs were more than three metres in length and moved in the same way as many two-legged dinosaurs, such as the T rex. No fossils of the croc's bones have been found yet, but researchers have named it Batrachopus grandis.

CHOOKS IN CHARGE

A VILLAGE in New Zealand has been taken over by

chickens! People in Titirangi in west Auckland got a shock when they came out of lockdown to find chickens were running wild. Before the pandemic, authorities had already caught around 230 feral chickens. But it's thought someone had been leaving chicken feed out, so the chooks have returned and seized the streets!
